From waste to value – Recycling ensures a new life for used plastics

REGO-FIX Group is proud to announce, that we are gradually shifting our plastic packaging from conventional plastics to fully high-quality recycling's. The use of recycled material for the production of packaging material reduces the use of fossil raw materials and lowers the energy demand at the same time. For example, twice as much energy is required to produce standard PET compared to recycling. In addition, there are 75% fewer CO2 emissions in comparison to the use of conventional granulate.

Sustainability plays an important part in our company philosophy, being ISO 14001 certified since 2008, REGO-FIX makes sure to manufacture and distribute the products in the most environmental-friendly way possible. Our resource and climate protection initiatives are on-going and this step into recycled packaging is just one practical example.

The reused plastic is just as robust as new plastic! This means that our products will be protected as reliable as compared to regular plastics. You will only notice a minor change in color, from a previously black to a lighter grey (matte anthracite).

Let's continue our ongoing initiatives to reduce our global footprint and ensure climate protection.
